SWIFTLOG LOGISTICS LIMITED

Executive Business Intelligence Report

Data Analytics & Power BI | January - September 2026

Executive Summary

SwiftLog's Power BI solution consolidates customer, order, product, inventory, warehouse, shipment and return data into an interactive management view. The analysis shows strong commercial activity, but delivery reliability is the clearest operational risk. The dashboard records 5,000 orders and 5,000 shipments, with total revenue of approximately 7.11 million across the reporting period.

Delivery performance requires immediate management attention. The dashboard KPI reports an On-Time Delivery Rate of 37.21% and an Average Delivery Delay of 3.52 days. Delivery-status counts show 3,186 delayed shipments out of 5,000 (63.72%). Lagos carries the greatest absolute delay burden, with 1,701 delayed shipments.

Executive KPI Snapshot

7.11M **Total Revenue** approx.	**5,000** **Total Orders**	**1,000** **Total Customers**	**250** **Total Products**
5,000 **Total Shipments**	**37.21%** **On-Time Delivery Rate** dashboard KPI	**3.52 days** **Avg. Delivery Delay**	**186** **Low Stock Products**

Primary management concern

Delivery performance is weak: nearly two-thirds of shipment status records are delayed.

Primary growth signal

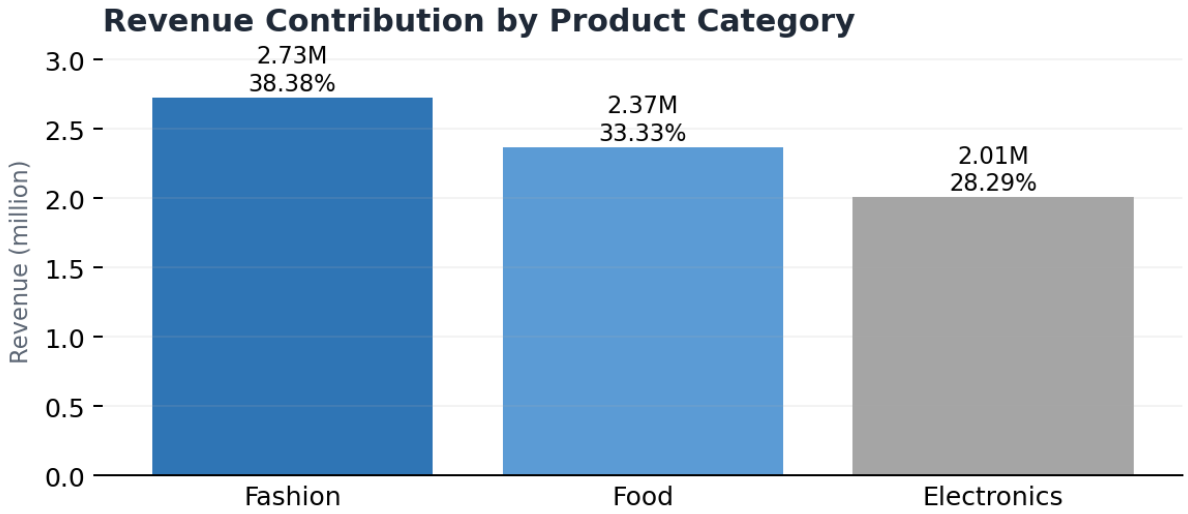

August was the strongest month, with 654 orders and approximately 2.85M in revenue.

Key Management Takeaways

- Delivery reliability is the most urgent operational issue and should be treated as a service-level priority.
- Revenue is diversified across Fashion, Food and Electronics, with Fashion contributing the largest share.
- A small group of products and customers lead revenue generation, creating clear targets for retention and stock protection.
- Inventory and warehouse monitoring should focus on low-stock exposure and uneven operational performance.
- Supplier and product-level return analysis is constrained by missing relational keys and should be strengthened at source.

1. Commercial & Customer Performance

Revenue performance is supported by all three product categories, reducing dependence on a single category. Fashion is the largest contributor at approximately 2.73M (38.38%), followed by Food at 2.37M (33.33%) and Electronics at 2.01M (28.29%).

Top Products and Customers

The strongest revenue-generating products are P203, P085 and P229. P203 is the leading product and should be protected from stockouts and service disruption. On the customer side, Customer 223, Customer 773 and Customer 599 are the top revenue contributors, making them priority accounts for retention and service management.

Rank	Revenue-leading Products	Revenue-leading Customers
1	P203	Customer 223
2	P085	Customer 773
3	P229	Customer 599

Seasonality and Demand

August recorded the highest business activity with 654 orders and approximately 2.85M in revenue. April was also strong, with 638 orders and approximately 2.74M in revenue. September data runs only through 8 September, so it should not be compared directly with complete months.

Management implication

Build stock, staffing and delivery capacity ahead of historically high-demand periods.

Customer implication

Use the highest-value customer group for targeted retention, proactive service and tailored commercial offers.

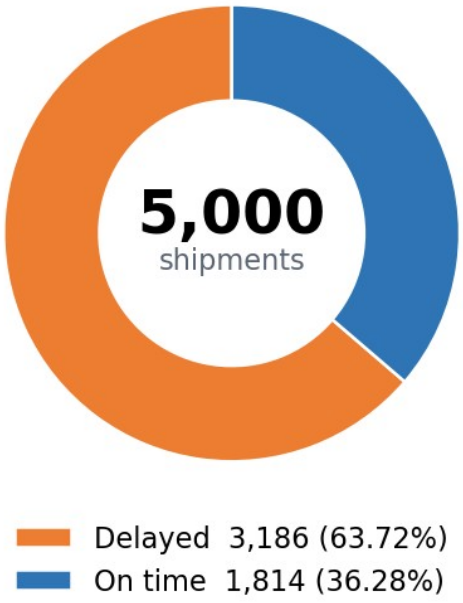

Dashboard Coverage

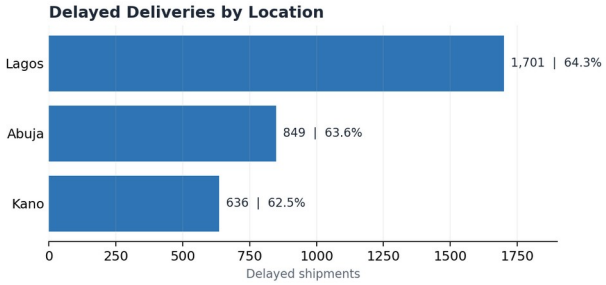

The Power BI solution includes Executive Dashboard, Executive Trends, Customer Analytics, Inventory & Warehouse Analytics, Shipment & Delivery Analytics, and Product & Supplier Analytics pages. It also includes a Product Details drill-through page and a Product Tooltip page, with synchronized month filtering, bookmarks, page navigation, dynamic titles and mobile layouts.

2. Operational Performance & Risk

Delivery Performance

Delivery performance is the most material operational weakness. Of 5,000 shipment status records, 3,186 are delayed and 1,814 are recorded as on time. The dashboard also reports an Average Delivery Delay of 3.52 days.

Lagos has the largest operational exposure, with 1,701 delayed shipments out of 2,647 total shipments (64.3%). Abuja records 849 delayed shipments out of 1,335 (63.6%), while Kano records 636 out of 1,018 (62.5%). The similarity in delay rates across locations suggests a system-wide delivery issue, while Lagos deserves first attention because of its higher shipment volume.

Warehouse & Inventory Performance

The network contains 15 warehouses. Warehouse W13 shows comparatively lower delayed-shipment volume, with W01 and W11 also performing relatively better on the available delivery indicator. These warehouses should be reviewed for transferable operating practices. A definitive warehouse-efficiency ranking is not possible because the source data does not contain warehouse capacity, operating cost or throughput targets.

Inventory monitoring identified 186 low-stock products. Management should use the low-stock view together with product revenue and units ordered to prioritize replenishment and stock transfers. Inventory turnover is presented as an analytical proxy because the source data does not include cost of goods sold or average inventory values required for the formal accounting ratio.

Returns and Data Quality

Returns are monitored by reason, including Damaged, Wrong Item and Late Delivery. However, product-level return rates cannot be reliably calculated because the Returns table contains OrderID but not ProductID or OrderItemID. Many returned orders contain multiple products, so assigning a return to a specific product would be ambiguous.

Supplier performance cannot currently be measured because the Suppliers table has no shared SupplierID relationship to Products, Shipments, Inventory or other operational tables. This is a structural data limitation rather than a dashboard calculation issue.

3. Strategic Recommendations

#	Recommendation	Business rationale / action
1	**Improve on-time delivery performance**	Review dispatch processes, routing, carrier handoffs and delay root causes. Delivery reliability is the most urgent KPI issue.
2	**Prioritize Lagos operations**	Investigate scheduling, workload and transport bottlenecks in Lagos, which has 1,701 delayed shipments.
3	**Benchmark stronger warehouses**	Review practices in W13 and other relatively lower-delay warehouses and replicate effective routines.
4	**Protect high-revenue products**	Prioritize replenishment and availability for P203, P085 and P229 to reduce lost-sales risk.
5	**Retain high-value customers**	Create targeted service and retention actions for Customer 223, Customer 773 and Customer 599.
6	**Prepare for peak-demand months**	Increase inventory readiness, staffing and delivery capacity ahead of periods similar to August.
7	**Rebalance inventory**	Use low-stock and warehouse inventory views to guide replenishment and inter-warehouse stock transfers.
8	**Reduce avoidable returns**	Track Damaged, Wrong Item and Late Delivery causes and assign corrective actions to packaging, picking and delivery processes.
9	**Strengthen source-data design**	Add relational supplier and product-return keys so supplier reliability and product return rates can be measured accurately.
10	**Institutionalize KPI monitoring**	Review revenue, delays, on-time rate, returns, inventory and customer performance on a recurring management cadence.

Expected Business Impact

- Higher delivery reliability and stronger customer experience through targeted delay reduction.
- Lower stockout risk and improved use of inventory through revenue-led replenishment and warehouse balancing.
- Better retention of commercially important customers through targeted account management.
- Improved management visibility through recurring KPI monitoring and exception-focused dashboards.
- More reliable supplier and returns analysis after closing the identified source-data gaps.

Conclusion

SwiftLog's Power BI solution provides a practical management view of commercial, customer, inventory, warehouse and delivery performance. The strongest immediate opportunity is to improve delivery reliability, particularly in high-volume operations, while protecting high-value products and customers. The dashboard also highlights important data-governance gaps that should be corrected to support supplier accountability and product-level return analysis. With these actions, SwiftLog can move from descriptive reporting toward more disciplined, exception-based operational management.
